SENDGRID INTEGRATION WITH PYTHON

Team ID	PNT2022TMID2530
Project Name	Nutrition Assistant Application

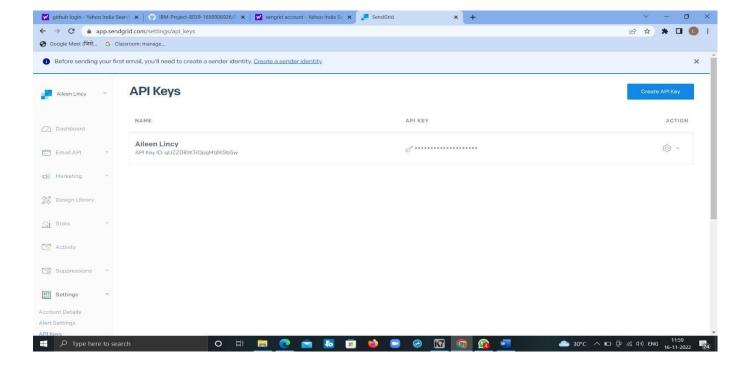

STEP 1:

REQUIREMENTS:

Python 2.6, 2.7, 3.4 or 3.5.

STEP 2:

Create an API key

STEP 3:

INSTALL

PAKAGE: > pip install sendgrid

SETP 4:

SEND EMAIL

```
| Desicon | Part | Desicon | Part | P
```

SENDGRID PYTHON CODE:

```
1 import os
2 from sendgrid import SendGridAPIClient
  from sendgrid.helpers.mail import Mail
5 message = Mail (
6
       from email='from email@example.com',
       to emails='to@example.com',
       subject='Sending with Twilio SendGrid is Fun',
       html_content='<strong>and easy to do anywhere, even with
   Python</strong>')
10 try:
11
      sg = SendGridAPIClient(os.environ.get('SENDGRID API KEY'))
12
      response = sg.send(message)
13
     print (response.status_code)
14
      print (response.body)
15
      print (response.headers)
16 except Exception as e:
17
     print (e.message)
```

HTTP CLIENT PROGRAM

```
1 """HTTP Client library"""
2 import json
3 import logging
4 from .exceptions import handle_error
5
6 try:
7  # Python 3
8  import urllib.request as urllib
9  from urllib.parse import urlencode
10  from urllib.error import HTTPError
11 except ImportError:
12  # Python 2
```

```
from urllib import urlencode
17 _logger = logging.getLogger(__name_)
      def__init__(self, response):
          :param response: The return value from a open call
                           on a urllib.build_opener()
          :type response: urllib response object
          self._status_code = response.getcode()

               Or just pass the version as part of the URL
            :param url: URI portion of the full URL being requested
            :type url: string
107
  url)
        def build url(self, query params):
111
112
113
114
            :param query params: A dictionary of all the query
```

```
parameters
            :type query params: dictionary
117
            url = ""
118
            while count < len(self._url_path):
121
                url += '/()'.format(self. url path[count])
122
124
            if self.append slash:
126
            If query params:
                url_values = urlencode(sorted(query_params.items()),
130
131
132
133
134
135
136
137
138
        def update headers(self, request headers):
139
140
            :param request headers: headers to set for the API call
            :type request headers: dictionary
           :return: dictionary
144
            self.request headers.update(request headers)
```

```
:param name: Name of the url segment
           :type name: string
           url_path = self._url_path + [name] if name else
 self, url path
                          request headers=self.request headers,
                          url path=url path,
                          append slash=self.append slash,
        def make request(self, opener, request, timeout=None):
            :param opener:
            :type opener:
            :param request: url payload to request
            :type request: urllib.Request object
170
172
            :return: urllib response
174
                return opener.open(request, timeout=timeout)
                exc = handle error(err)
179
                exc. cause = None
                logger.debug('(method) Response: (status)
```

```
method=request.get method(),
                   status=exc.status code,
                   body=exc.body))
               raise exc
               (e.g. /your/api/(variable value)/call)
              Another example: if you have a Python reserved word,
190
              in your url, you must use this method.
191
          :param name: Name of the url segment
           :type name: string
194
195
196
       def getattr (self, name):
              (e.g. client.name.name.method())
              You can also add a version number by using
  .version(<int>)
           :param name: Name of the url segment or method call
            :type name: string or integer if name == version
           :return: mixed
           if name == 'version':
               def get version(*args, **kwargs):
                   :param args: dict of settings
                   :param kwargs: unused
```

```
213
                    self. version = args[0]
218
219
            if name in self.methods:
               method = name.upper()
221
                def http request (
223
                        request body=None,
224
                        query params=None,
                        request headers=None,
227
229
                    :param timeout: HTTP request timeout. Will be
  propagated to
                        urllib client
231
                    :type timeout: float
232
                    :param request headers: HTTP headers. Will be
  merged into
234
                    :type request headers: dict
235
                    :param query params: HTTP query parameters
236
                    :type query params: dict
                    :param request body: HTTP request body
238
                    :type request body: string or json-serializable
239
                    :param kwargs:
240
241
242
                    ! request headers:
```

```
243
                        self. update headers (request headers)
244
245
                    if request body is None:
246
